

ARTIFICIAL INTELLIGENCE BILLING DELEGATION STANDARD

ABDS v0.6

Provider-enforced funding, consent receipts,
usage evidence, reconciliation, and settlement

OAuth-aligned

Payer-neutral

Append-only audit

From authorization to trustworthy accounting

v0.6 is a narrow trust extension of the v0.5 accounting architecture.

Existing v0.5 schema identifiers remain unchanged.

The v0.6 trust chain

Each object answers a different authorization, execution, evidence, or accounting question.

Authorization boundary

Receipt: what was approved.
Grant: current Provider policy.
Token: short-lived execution authority.

Mutable balances never live in bearer claims.

Evidence boundary

Usage Event: what occurred.
Evidence class: who asserts it.

Gateway observations remain provisional until
Provider evidence is available.

Economic boundary

Reservation and settlement remain Provider-
authoritative.

Late differences create reconciliation and
compensating adjustments - not rewritten history.

Three evidence classes

Authority must be explicit rather than inferred from where an event was stored.

PROVIDER-SIGNED

Provider event, settlement receipt, or verifiable batch manifest.

Preferred provider-native target.

Binds issuer, Provider request/event IDs, digest, key ID, signature format, signature, and time.

PROVIDER-REPORTED

Authenticated Provider API response, usage endpoint, export, or billing record.

Provider evidence without a native ABDS signature.

Preserve Provider request and billing references.

GATEWAY-ATTESTED

Gateway estimate or locally observed response.

Useful for current APIs, but provisional.

Must not be represented as Provider-authoritative evidence.

estimated -> gateway observed -> Provider reported -> reconciled -> final

Consent Receipts make approval auditable

The current grant state is not enough to prove what was approved earlier.

BOUND TERMS

- Grant and Client
- Beneficiary
- Funding source and payer
- Spend ceiling and period
- Per-request ceiling
- Model and operation scope
- Enforceable workload scope
- Overage and exhaustion
- Effective and expiry times

PRIVACY

- Sponsor reporting mode
- Funding does not grant content access
- Identity access is separate
- Revocation path
- Versioned policy
- Immutable receipt digest
- Optional Provider signature

One reservation, many child events, one settlement

Failed attempts remain visible without creating duplicate charges.

Attribution is retained for both the Beneficiary and the registered Client that generated the workload.

Late Provider usage is reconciled - never rewritten

Every variance is reproducible and idempotent.

Invariant

adjustment quantity =
Provider final - original

Zero variance means no economic change.

Preserved bindings

Grant, Client, request, unit type, funding bucket,
Provider request ID, and original event reference.

Forbidden behavior

No historical rewrite.
No second settlement.
No silent payer switch.
No unmatched charge without investigation.

v0.6 deliverables and practical next step

The specification is ready for a mock provider-native reference application.

DELIVERED IN v0.6

- Usage Event schema guide
- Consent Receipt profile
- Evidence and reconciliation profile
- Three JSON Schemas
- Four positive examples
- Six negative fixtures
- Replay, ordering, signature, binding, and adjustment validation
- Updated discovery, threat model, profiles, diagrams, and change control

ABDS STUDIO v0.7

- Mock Provider authorization
- Sponsor and user consoles
- Consent Receipt issuance
- Run-level reservation
- Physical attempt timeline
- Provider-signed evidence
- Gateway reconciliation
- Settlement and adjustment
- Revocation and exhaustion
- NatureGuard reference scenario

REVIEW NEEDED

- Production signature profile
- Batch evidence and inclusion proofs
- Minimum Consent Receipt core
- Reconciliation windows
- Invoice-level mapping
- Provider economics
- OAuth and security review
- Privacy-safe Sponsor reporting

Draft proposal - no Provider adoption claimed.
